

Latex : document markup language

on July 15, 2019

L^AT_EX

What is Latex?

LaTeX is a typesetting language used for writing formatted documents in a highly controlled fashion. It is widely used for scientific documentation, research and thesis purpose.

There are many software for Latex. I recommend TexMaker both for windows and Linux.

For windows you can download

via <https://www.xm1math.net/texmaker/download.html>

For linux user you can download using apt install

```
sudo apt install texmaker
```

You can follow this youtube tutorial to get hands on Latex.

<https://www.youtube.com/playlist?list=PL1D4EAB31D3EBC449>

The major benefit of using latex is that you can organize your content and make table of content very easily.

Writing equation in Latex is little bit lengthy. I searched for it and found an easy tool that converts math equations in a latex command.
