Semicolon (;) in python

on December 02, 2017

Hey everyone,

If you have done some python code then I guess you may never be used the semicolon in your program. Till now, me neither. Actually, I found that python also supports semicolon but not as a terminator but as a separator. Now, what does this separator mean? Well its nothing but separating multiple statements which written in a single line.

For example :

```
a = 5
b = 6
c = 7
print(a)
print(b)
print(c)
```

Now, this all lines can be written as below:

```
a=5; b=6; c = 7; print(a) ; print(b); print(c)
```

Wanna make it shorter

```
a,b,c=5,6,7;print(a,b,c)
```

PYTHON
