Linux #1 : Commands useful during update

on July 14, 2017

If the Commands fails you can try these ones:

Update Packages

```
 sudo apt-get update
```

clean the downloaded packages (where there might be broken ones)

```
sudo apt-get clean
```

Remove unneeded packages (careful! If it might list something that is needed but its dependency or such have been removed and left it orphan)

```
sudo apt-get autoremove
```

Reconfigure all packages

```
sudo dpkg --configure -a
```

Fix broken packages

```
sudo apt-get install -f
```
